

Complete Solution

Treat Your Pet's Habitat with BactroBUG

If your pet continues to show signs of re-infestation after treatment, it is likely that its habitat is also infested. To eliminate your infestations, treat your pet's habitat and your home with BactroBUG. Spray your pet's habitat and all of its bedding, pillows and any other fabrics and textiles that are used as furnishings. Provide heavy mist to kennels, 'dog houses', and cat perches. Wipe excess with microfiber cloth.

Treating your Home with BactroBUG

Using BactroBUG, mist all fabric and textile areas. This should include carpet areas, drapes, furniture cushions, bedspreads, mattresses and box springs throughout your entire house. Excess spray may appear as a 'dust' on dark surfaces or glass. Over spray may be removed with a damp microfiber cloth. Mist soiled clothes that have been placed in hampers or laundry areas.

How BactroBUG Works

BactroBUG is completely safe for pets, adults and children, when applied according to directions. The product acts to emulsify the waxy outer layer of the tick or flea. This allows the small amount of inner fluids to evaporate, resulting in death by dehydration. Since ticks "bore" into skin tissue, BactroBUG works more slowly so they fall off before they are killed so they are not trapped in your pet's body. This is a "physical" process that is harmless to your mammalian pet and to you while it remains deadly to fleas and ticks.

BactroBUG Pet Care Flea and Tick Killer 100% Non-Toxic

BactroBUG is a breakthrough product that kills fleas and ticks on contact and is nontoxic to mammal pets and humans. It is safe to use around children with no risk of toxic product transfer from pet flea & tick collars or insect spray repellants.

Provides 30-90 Days of Residual or Between Shampoos

BactroBUG incorporates residual qualities that acts as a continuing deterrent to reinfestation as nymphs emerge from eggs. You can protect your pet, your household and your family from the dangers and annoyance of flea and tick infestations. You can end the constant painful itching and scratching that torments your pet with out the use of dangerous toxins.

Protect yourself and your family without having to use products that contain chemicals recognized as environmental hazards.

Treating Your Pet

1 Shake bottle and turn nozzle to Spray. Gently hold your pet with one hand and beginning at the hind quarter, softly back stroke your pet's coat so as to expose its skin and the layers of its coat.

2 Mist all areas as they are exposed until you have treated your entire pet, back to front and massage BactroBUG deep into the coat.

3 As you prepare to treat your pet's face, gently shield the eyes with one hand and mist with the other. Be sure not to spray the eyes directly. If you do, rinse with tap water.
