August 2019- Bactronix Tips and Advice

What Should You Know About Mold In Your Home?

Mold spores can be found on nearly any surface inside and outside. When mold spores are supplied with sufficient moisture and ideal temperature conditions they rapidly breakdown materials such as wall paper, sheet rock paper, wood and drywall. It is this growth process that creates the characteristic “musty odor” commonly connected with actively growing fungal contamination.

When the fungi grow, they extend root like extensions called hyphae into the material and absorb its nutrients into their cells. Mold releases tiny light weight spores which travel through the air. These spores may cause serious health issues. For some people a relatively small number of mold spores can trigger reaction. For others, symptoms may occur only when exposure levels are much higher. Individuals with existing respiratory conditions such as asthma or allergies, weakened immune systems, infants, young children and elderly can be effected quickly.

What Should You Know About Mold In Your HVAC?

High water vapor content is particularly prone to mold buildup within the ducts. Water vapor can form within the duct system when cold air passes through. When there is high water vapor content in the outside environment, the water droplets usually collect instead of evaporating. It forms the perfect environment for mold growth. The nutrition for the mold usually comes from dust, dirt, dead skin cells, pollen, and animal dander that collects over months inside the duct along with the water.

What are the signs of mold in air ducts?

-A strong mildew-like or musty smell throughout the house or at least in a few adjacent rooms.
-Your nose, throat, and eyes feel irritated when you switch on the air conditioning or step inside an air-conditioned room.

-You are experiencing allergic symptoms including a runny nose, rashes, and watering eyes.

-You or your family is suffering from unexplainable headaches that go away when you step outside.

-You feel nausea, fatigue, and dizziness only when you are home.

-You can see the mold growing within the intake vents and around the air ducts and drip pans.

You should never wait for the visible signs of infestation to manifest before taking action. You may not be able to see specific sections of your HVAC ductwork from the outside. In that case, you should ask for professional help from Bactronix. Our Specialists understand the ductwork of your home is like the arteries to a human body. They need to stay clean and disinfected in order to have a healthy home. Our Service Technicians are qualified and trained for HVAC cleaning and disinfection. A great way to help maintain your ductwork and furnace is with BactroKill. BactroKill is EPA registered for HVAC disinfection. When you replace your furnace filter always spray both sides of the filter with BactroKill. Replace while system is running. This will continue to eliminate mold, odors and allergens that pass through the furnace. Be sure to spray BactroKill into the intake vents while the system is running.
